

Modern Monetary Policy Regimes: Mandate, Independence, and Accountability

Lars E.O. Svensson
Sveriges Riksbank

ECPRD Seminar, Stockholm, June 2007

1

Modern Monetary Policy Regimes

Three pillars (Chuck Friedman, Bank of Canada):

1. Mandate
2. Independence
3. Accountability

2

1. Mandate

- Possible objectives for monetary policy: What can monetary policy achieve?
 - Long run
 - Nominal variables (price level, inflation, exchange rates,...): Level and variability
 - Real variables (output, employment, unemployment, output gap, resource utilization,...): Not levels, only variability
 - Possible tradeoff between variability of real and nominal variables
 - Imperfect control

3

1. Mandate

- Possible objectives for monetary policy: What can monetary policy achieve?
 - Short run
 - Permanent impact on nominal variables
 - Temporary impact on real variables
 - Lags: Variable, 1-2 years
 - Uncertainty:
 - Current state of the economy
 - Future effect on real and nominal variables of given monetary policy action
 - Forecasts!

4

1. Mandate

- Suitable objectives for monetary policy: What should monetary policy try to achieve?
 - Nominal stability
 - “Price stability”: Low and stable inflation
 - Costs of high inflation
 - High inflation variability → more uncertainty in economic decisions
 - Distortions (taxes, demand for financial services, transactions costs, ...)
 - Arbitrary redistributions (owners vs. renters, borrowers vs. lenders, ...)

5

1. Mandate

- Suitable objectives for monetary policy: What should monetary policy try to achieve?
 - Real stability
 - Stable resource utilization
 - “Flexible inflation targeting”: Low and stable inflation as well as stable resource utilization
 - Reasonable compromise between stable inflation and stable resource utilization

6

Flexible inflation targeting

- 1. Numerical inflation target
- 2. “Forecast targeting”: Setting the interest rate (an interest-rate path) such that forecasts of inflation and resource utilization “look good”
- 3. A high degree of transparency and accountability

7

Numerical inflation target

- Target and index specified by government, parliament, or central bank
 - Government: NZ, Canada, UK, Australia, Norway
 - Central bank: Euro area, Sweden
- Pros and cons
 - Government/parliament commitment to inflation target
 - Target level and index not suitable as election issue
 - Index and level of target arguably a technical question

8

Numerical inflation target

- Target explicitness, level, and index vary across countries
 - Implicit target (“comfort zone”) for (core) PCE deflator (Fed)
 - “Below but close to 2%” (ECB)
 - Point target (2%, 2.5%), point target w/ range (2%±1%), range (1-3%, 2-3% over the cycle)
 - Headline inflation (CPI, HICP, ...), underlying (core) inflation (CPIX, RPIX, UNDIX, ...)

9

2. Independence

- Avoids short-run interference by governments/parliaments: Political business cycle
- Avoids “inflation bias”
- Allows longer horizon in monetary policy
- Emphasizes responsibility for fulfilling mandate

10

2. Independence

- Several dimensions of independence
 - Functional, institutional, personal, financial
 - Goal vs. instrument
 - Formal (legal) vs. informal (actual)

11

2. Independence

- Strong international trend towards increasing independence (RBNZ 1990, Bank of England 1997, ECB 1998, Sweden 1999)
- Degree of independence varies across countries
- Norges Bank Watch 2002: “Monetary policy among the best in the world; institutional framework among the worst in the world”
- Informal independence even if not formal
- Safer with formal independence

12

3. Accountability

- Democracy: Independence requires accountability (Blinder)
- Efficiency: Accountability strengthens CB incentives to fulfill mandate
- Accountability requires transparency

13

Transparency

- Strengthens accountability
 - Improves discussion and evaluation of monetary policy
 - Improves efficiency of monetary policy
 - More effective “management of expectations”
 - Publishing interest-rate forecasts affects interest-rate expectations

14

Transparency

- Degree of transparency varies across countries
 - Inflation target, stabilization of resource utilization
 - CB forecasts, analysis, motivation for decisions (Monetary Policy Reports)
 - Analysis of outcomes: Unanticipated shocks, etc.
 - Alternative scenarios (interest rates, shocks, international developments, ...)
 - Forecasts of output, output gap, resource utilization
 - Interest-rate forecasts (NZ, Norway, Sweden, ...)
 - Attributed (Sweden) vs. nonattributed minutes

15

Transparency

- Possible improvements:
 - Interest-rate forecasts (optimal interest-rate plans)
 - Resource-utilization stabilization
 - Weight relative to inflation stabilization
 - Role in decision process
 - Forecasts of potential output and output gap
 - Explicit loss functions and explicit optimal policy

16

Accountability in practice

- Current discussion by experts and interested parties in media, reports, conferences, etc.
- Parliaments and governments: Evaluation of **past** policy, **not** interference in **current** policy
 - Respect independence
- Hearings in Parliaments
 - Avoid superficial political points
 - Expert assistance, evaluation reports, questions
 - Submissions from interested parties

17

Accountability in practice

- Official evaluations by experts
 - New Zealand 2001, Sweden 2007,...
- Independent evaluations (could be sponsored by CB)
 - Norges Bank Watch
 - Annual conference (ECB Watchers' Conference, US Monetary Policy Forum)

18

Accountability in practice

- Evaluation of monetary policy: Difficulties
 - Lags (1-2 years), uncertainty
 - Current inflation affected by policy about 2 years ago
 - Current inflation on target
 - Policy right 2 years ago, unanticipated shocks small or cancel
 - Policy wrong 2 years ago, unanticipated shocks compensate (luck)
 - Current inflation off target
 - Policy right 2 years ago, unanticipated shocks explain deviation
 - Policy wrong 2 years ago, unanticipated shocks don't compensate
 - Ex post evaluation difficult: Must identify shocks to judge policy

19

Accountability in practice

- Evaluation of monetary policy: Difficulties
 - Ex ante evaluation of decisions better
 - Evaluate decision given info at the time of decision
 - Requires transparency: CB info at the time
 - Compare w/ other forecasts/policy recommendations at the time

20

Modern monetary policy regimes

- Mandate, independence, accountability
- Flexible inflation targeting
- Overall: Works very well in many countries
- Room for further improvements of transparency and accountability
- Accountability in practice, evaluations
- We learn more from some variety across countries
