## Forecasting with a model of data revisions

Jana Eklund, ${ }^{1}$<br>George Kapetanios ${ }^{1,2}$<br>\& Simon Price ${ }^{1,3}$<br>${ }^{1}$ Bank of England<br>${ }^{2}$ Queen Mary University of London<br>${ }^{3}$ City University (London)<br>Modelling and Forecasting Economic and Financial Time Series with State Space Models<br>Sveriges Riksbank, 17 October 2008

(1) Introduction
(2) State Space Model
(3) Forecasting
(4) Conclusions

## Data uncertainty

- Published data are estimates rather than perfect measures
- Measurement errors due to incomplete samples or proxies
- Statistical agencies revise their estimates - larger samples or better proxies
- State space modelling - usual approach to extracting signals
- Model the cumulative impact of revisions

## United Kingdom real GDP

Real-time published estimates from 1993

## Revisions in the United Kingdom

Across a range of macroeconomic variables revisions have tended to be

- Large relative to the variance in published data
- Occur several years after the first release © Chart
- Initial estimates tend to be revised upwards
- Revisions to quarterly growth rates tend to be partially offsetting from one quarter to the next (negative serial correlation)

## Extract From the Real-time Database

Quarterly Growth of Whole Economy Investment

|  |  | Release date |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 2003 Q1 | 2003 Q2 | 2006 Q3 | 2006 Q4 |
| $\stackrel{0}{0}$ | 2002 Q4 | -0.15 | 0.16 | 3.51 | 3.51 |
| - | 2003 Q1 |  | -1.13 | -3.18 | -3.18 |
| \% | $\vdots$ |  |  | ! | ! |
| 边 | 2006 Q2 |  |  | 1.31 | 1.21 |
|  | 2006 Q3 |  |  |  | 1.32 |

## Stylised Real-time Database - Maturity of Observations

|  |  | Release date |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 2003 Q1 | 2003 Q2 | 2006 Q3 | 2006 Q4 |
| $\stackrel{\square}{0}$ | 2002 Q4 | 1 | 2 | 15 | 16 |
| - | 2003 Q1 |  | 1 | 14 | 15 |
|  | $\vdots$ |  |  | ! | ! |
| $\stackrel{\square}{4}$ | 2006 Q2 |  |  | 1 | 2 |
|  | 2006 Q3 |  |  |  | 1 |

## Policy implications

- Policymakers need to know what the state of the economy in order to set policy appropriately: understanding revisions process may help this
- Policy often seen as a forward looking exercise
- Forecasts also summarise dynamic impact of shocks and policy
- Possible - likely? - that better nowcasts would help forecast process

## Modeling assumptions

- Official data improve with maturity
- Latest release subsumes earlier vintages
- Does not forecast specific ONS releases

## The model of the published data

$$
y_{t}^{t+n}=y_{t}+c^{n}+v_{t}^{t+n}
$$

- $y_{t}^{t+n}$ - an estimate of $y_{t}$ published at time $t+n$, $n=1, \ldots, T-t$
- $y_{t}$ - the true data
- $c^{n}$ - bias at maturity $n$
- $v_{t}^{t+n}$ - measurement error associated with the published estimate

## The model for the true data $y_{t}$

$$
y_{t}=\mu+\sum_{i=1}^{q} \alpha_{i} y_{t-i}+\epsilon_{t}
$$

Assumptions:

- Stationarity of $y_{t}$ - suitable for differenced or detrended data
- Linear functional form

## Modelling choices

(1) Bias

$$
c^{n}=c^{1}(1+\lambda)^{n-1}
$$

- $c^{1}$ - initial bias in published data
- $-1 \leq \lambda \leq 0$ - rate at which bias decays as data become more mature
(2) Serial correlation with respect to time

## Modelling choices

(1) Bias

$$
c^{n}=c^{1}(1+\lambda)^{n-1}
$$

- $c^{1}$ - initial bias in published data
- $-1 \leq \lambda \leq 0$ - rate at which bias decays as data become more mature
(2) Serial correlation with respect to time

$$
v_{t}^{t+n}=\sum_{i=1}^{p} \beta_{i} v_{t-i}^{t+n}+\varepsilon_{t}^{t+n}
$$

- is a finite AR process with maturity invariant parameter
- $\mathrm{E}\left(\varepsilon_{t}^{t+n}\right)^{2}=\sigma_{\varepsilon^{n}}^{2}$

## Modelling choices

(3) Heteroscedasticity with respect to maturity

$$
\sigma_{\varepsilon^{n}}^{2}=\sigma_{\varepsilon^{1}}^{2}(1+\delta)^{n-1}
$$

- $\sigma_{\varepsilon^{1}}^{2}$ - initial variance in published data
- $-1 \leq \delta \leq 0$ - rate at which variance decays as data become more mature
(1) Correlation between errors
$\operatorname{cov}\left(\epsilon_{t}, \varepsilon_{t}^{n}\right)=\rho_{\epsilon \varepsilon} \sigma_{\epsilon} \sigma_{\varepsilon^{n}}$

## Modelling choices

(3) Heteroscedasticity with respect to maturity

$$
\sigma_{\varepsilon^{n}}^{2}=\sigma_{\varepsilon^{1}}^{2}(1+\delta)^{n-1}
$$

- $\sigma_{\varepsilon^{1}}^{2}$ - initial variance in published data
- $-1 \leq \delta \leq 0$ - rate at which variance decays as data become more mature
(9) Correlation between errors

$$
\operatorname{cov}\left(\epsilon_{t}, \varepsilon_{t}^{n}\right)=\rho_{\epsilon \varepsilon} \sigma_{\epsilon} \sigma_{\varepsilon^{n}}
$$

## The model

$$
\begin{aligned}
y_{t}^{T} & =c^{n}+y_{t}+v_{t}^{T} \\
y_{t} & =\mu+\sum_{i=1}^{q} a_{i} y_{t-i}+\epsilon_{t} \\
v_{t}^{T} & =\sum_{i=1}^{p} b_{i} v_{t-i}^{T}+\varepsilon_{t}^{T}
\end{aligned}
$$

## Revisions

$$
w_{t}^{j, n}=y_{t}^{t+n+j}-y_{t}^{t+n}
$$

- Can obtain matrix $\mathbf{W}$ of revisions
- rows contain revisions of a specific maturity
- columns contain revisions within a single release

## Two-step approach

Using only the latest release - does not mean that past releases are uninformative
(1) Using revisions to estimate

- $\operatorname{bias}\left(\lambda, c^{1}\right)$
- heteroscedasticity $\left(\delta, \sigma_{\varepsilon^{1}}^{2}\right)$
- serial correlation $\left(b_{i}\right)$
- correlation with economic activity $\left(\rho_{\epsilon \varepsilon}\right)$
(2) Estimate remaining parameters $\left(a_{i}\right)$ using Kalman filter

## Reasons for two-step approach

- For $N \rightarrow \infty$
- GMM estimates are $\sqrt{N T}$ consistent
- ML estimates $\sqrt{T}$ consistent
- More data in the first step - lower variability in the estimates
- In practice: variability not taken into account in the second step

## Growth for five National Accounts variables

- GDP
- Household consumption
- Whole economy investment
- Economic exports
- Economic imports

## Evaluation setup

- Estimation over 1993Q2-2003Q1 releases
- Evaluation period 1998Q2 - 2003Q1
- Two subsamples 1998Q2 - 2000Q3 and 2000Q4-2003Q1
- Excluding revisions: 1998Q3 for all variables (ESA 1995)
- Comparing forecast from the state space model with published data 16 nexieds later
- Comparing simple AR forecast based on contemporaneous data with releace 16 nerinds later

## Evaluation setup

- Estimation over 1993Q2-2003Q1 releases
- Evaluation period 1998Q2 - 2003Q1
- Two subsamples 1998Q2-2000Q3 and 2000Q4-2003Q1
- Excluding revisions: 1998Q3 for all variables (ESA 1995)
- Comparing forecast from the state space model with published data 16 periods later
- Comparing simple AR forecast based on contemporaneous data with release 16 periods later

## Ratio of RMSFE 1998Q2 to 2003Q1

Minimum in bold,* indicates a significant DM statistic
(a) Fixed four lags for $y_{t}$

| $h$ | GDP | Consumption | Investment | Exports | Imports |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0.9186 | 0.9738 | $\mathbf{0 . 8 9 1 8}$ | $0.9083^{*}$ | $\mathbf{0 . 8 7 4 5}^{*}$ |
| 2 | 0.9425 | $\mathbf{0 . 9 7 1 0}$ | 0.9444 | $0.9257^{*}$ | 0.8813 |

## Conclusions

- Using state-space approach to obtain better estimates of the 'true' value
- Practical and parsimonious way of producing backcast series
- Only have short periods for estimation and evaluation
- In the majority of cases forecast performance is improved

## Successive estimates of GDP growth in 1993

4 Back

## United Kingdom real GDP
